Outline

1. Describe the Mt. Pinatubo Eruption
2. Basic Atmospheric Impacts
3. Tracer Impacts and Overturning Circulation
4. TEM?

The 1991 Eruption of Mt. Pinatubo

June, 1991

Self et al. 1993

Problem Statement

Question:

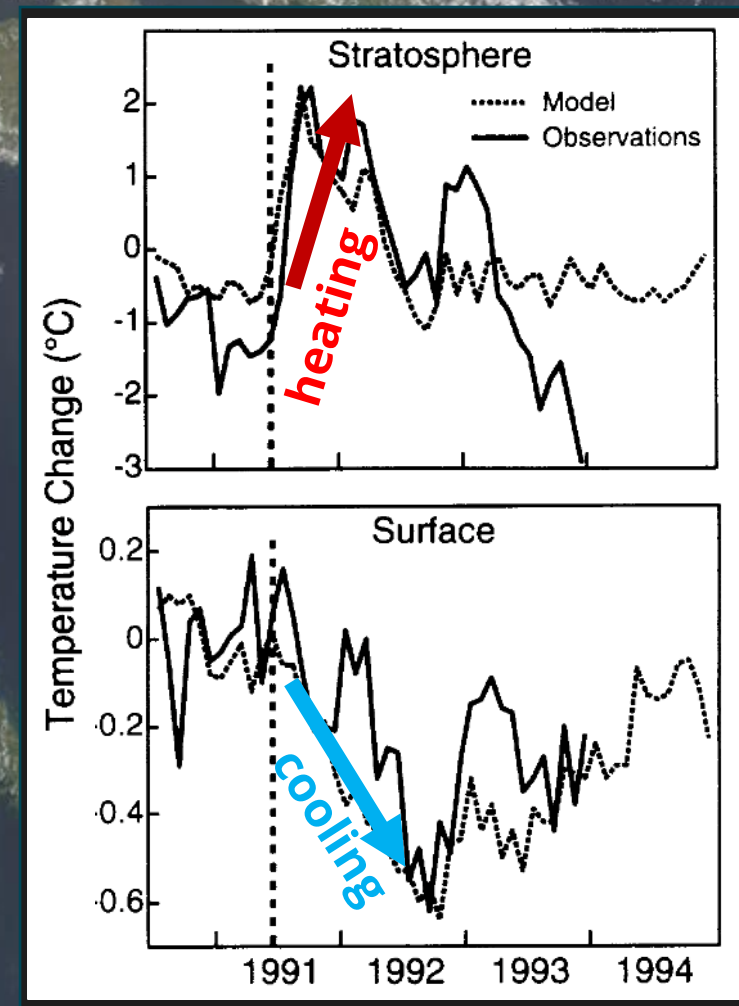

What happens to the general circulation of the atmosphere in response to this volcanic aerosol temperature signature?

- direct effects?
- indirect ("downstream") effects?
- physical mechanisms?

Why we care:

In the an age of climate change and international consideration of geoengineering mitigation activities, it is crucial that we:

- understand atmospheric "side effects" of aerosol radiative heating
- identify mechanisms by which stratospheric heating can couple to surface conditions beyond temperature

Experiment Results: TEM momentum budget

Concluding Remarks

- Stratospheric aerosol forcing affects the Earth's climate in complex ways
- Specific physical mechanisms giving rise to observed impacts are subtle and difficult to identify
- However, our simulation and analysis methodology seem to be allowing us to find these highly nonlinear climate impacts of large volcanic eruptions

Future Work

- We have begun to develop sound tools and methodology, but have not yet answered the question; *what happens to the general circulation in response to stratospheric aerosol forcing, and by what mechanisms?*
To make progress toward this goal:
- Statistical significance of some of the findings is lacking; **more ensemble members** are in production
- Impact analysis is being done on many **more variables**, and with regional focus **beyond the NH midlatitudes**
- TEM Budget methods are being **extended** to an analogous framework for tracer concentrations
- We need to conceive of simple metrics for quantifying climate impacts in **further reduced datasets** (e.g. 1-D expressions of impact strength)
- Finally, we will be searching for trends in the presented measures, with respect to total injected mass for **size-varying volcanic events**. The datasets to enable this have been produced.

Acknowledgements

Many thanks to my advisor Christiane Jablonowski, and many collaborators at Sandia, including Diana Bull, Tom Ehrmann, Ben Hillman, and others. Also many thanks to our very welcoming and supportive group manager Tom Lowry, and to the FORCEE team for their support and organization.
Funding was provided via the CLDERA Grand Challenge

Thank you for your attention!
